retinoblastoma: p5%; tumour suppressor; inhibitor; arterioscherosis;
proliferation; immortal; tumour therapy; macular degeneration; activator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          treat conditions related to (premature) ageing, e.g. machine degeneration and arteriosclerosis. The cells can also be used to replace tumour cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Rb/INK4 pathway, especially an Rb/plsiNK4a pathway. The encoprotein MiM2 is a cellular inhibitor of Rb/EzF function and the p5 tumbour suppressor and can also be used in the methods, other molecules which can be used include cdk4 or cdk6 mitants. In particular, a cdk mutant is one which differs from at one or more of residues Kzz, KZ4, H95 and/or P97.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    lines in vitro and for studies on biochemical and physiological aspects of growth and differentiation. Long lived (immortal) cells could also be of use in the production of normal or genetically engineered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention concerns methods and reagents for extending the life span,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New method for increasing the proliferative capacity of cell lines comprises administering agents reversibly activating felomerase activity and reversily iganticating ELTINMA and/or (5) pathways useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            e.g. the number of mitotic divisions, of a cell. The method relies on activation of a relomerase activity and inhibition of one or horh of a relimphastoma (Eb)/INK4 pathway or a p53 pathway. Phereforeylation of a by cyclin-dependent kinases, cdk4 and cdk6, releases the cells into the division cycle. Binding of INK4 family members, e.g. the tumour suppressor p16 NK4a, inhibits kinase activity and results in growth agreet. By inactivators can selectively and reversibly inactivate an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Additional constructs include a papilloma virus E7 profesin, or other viral oncoprocein which bypasses Rb and/or p64. Antisense constructs of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            increasing the proliferative capacity of cells. He cells are subsequently of use in pharmaceutical and cosmetic preparations used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the Rb and p16INK4a genes may also be used. The methods are useful for

                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a method (MI) for screening for an anti-inceptatic agent. The method involves exposing cells to a chemical anti-inceptatic activity, determining a change in expression of at least one gene (1) of a signature gene set, where (1) comprises a sequence (8) selected from 8447 sequences (given in ABLEB1664 to ABL20110), or is at least 95% identical to (8), where a change in expression is indicative of anti-neoplastic activity. (1) has eytostatic activity and can be used in gene therapy. Mican be used for screening as anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the until neoplastic agent as a structure and the data is sufficient to convey the chemical structure and and the data is sufficient to convey the chemical relational treatment of cancer such as colon, breast, stomach, lung, thyrold,
                                                                                                                                                                               Horrigan S,
                                                                                                                                                                                                                                                                                   Surpening for anti-neoplastic agent involves exposing cells to a chemical agent to be rested for anti-neoplastic activity and determining a change in expression of a gene of a signature gene set

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the nucleic acid sequence of a cDNA of the normal human retinoblastoma gene Rb. Absence or mutation of the Rb gene (see iso AAXO4502) predisposes an individual to retinoblastoma. To isolate Rb cDNA, the human DNA probe pH3 8, isolated from a human chromosome 13 lambda phage library, was used in a chromosome walk to isolate and map 30 kb of genemic DNA surrounding the H7-R sequence. Fragment p7H90 TYTCC 97500) was obtained, and was sequence. It is a probe to series a cDNA library that had been constructed from an adenovirus 12 transformed human embryonic retinal celling. This provided clone pf 7k (ACC 97343) which in northern those cross-reacted with a 4.7 kb transcript in transformed retinal cells which was not present in 4 telinoblastoma and one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         250 AAAGAAATTGATACCAGTACCAAAGTTGATAATGCTATGTCAAGAGTGTTGAAGAAGTAT

                                                                                                                                                                                                                                                                                                                                                                                             Inis sequence encodes a modified relinchlastoma Lumous suppressor protein (Kisb) of the invention. The proteins can be used for inhibiting eviluate proliferation, when coadministered with a p53 protein. The Risps can be used for treating diseases characterised by abnormal cellular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        proliferation, particularly cancers. The PTSPs have a broader spectrum of activity than wild type RTSPs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    4 H. The invention relates to an anticancer agent comprising mycolactone.

Also included for is an anticancer agent comprising mycolactone and antiscuss inhibitors of retinoblastoma (RB) protein expression. The anticancer agent is used for the treatment of cancers such as breast, bludder, spin, stomach, liver, colon and oral cavity, lymphoma and bludder, spin, stomach, liver, colon and oral cavity, lymphoma and capta and the Rb inhibitor increases the apoptosis-inducing activity of mycolactone even in Rb positive cancer cells. The agent is specific to connects in which Rb proteins are optionally expressed and mycolactone shows very strong anticancer election vite as in two.

The present sequence is the human cDNA for refinoblastoma protein.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence appears in the specification, which describes a

they can be used for the production of proteins such as tumour suppressor proteins which can be used for treating diseases characterised 7.9 ACCIGATITIACIONAFTATGINADAAATTAAAGATAGCAGATGATGATGAGAGAGAGAG 128 | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | HILL | 129 GACANAACCCAGCAGTTCCATALCTACTGAAATAAATTCTGCATTGGTGCTAAAAGTTTC 488 189 TIGGALFAGAFIITIAITAGIAAAGGGGAAGTATTACAAATGGAAGATGAIGTGGTGAT 548 SCICAAAGAACCATATAAAAACACTGTTAFAQCCATTAATGGTTTCACTCGAACACCCAG 668 289 AAATTITTATGAATTCTCTTGGACTTGTAACATCTAATGGACTTCCAGAGGT 848 129 IIGGITAANTIGGGAGAAAGTIIGAICTGTGGAGAGTATTGGGAGGTTATTGTAAA 188 189 GAAAAAAGGAAFGTGFFFATGTGTATTTAFFGCAGCAGTTGACCTAGAFGAGTGTC 248 249 GIIMACIIIFACIMAGMAAAAAAAAAAAAGAAATGAGMAGATAAAITGMTAACTT 308 409 ACTAAAAGAAATTGATACCAGTACCAAAGTTGATAATGCTATGTGAAGAGTGTGTGAAGAA 368 469 GTATGATGTATTGTTTGCACTCTTCAGGAAATTGGAAAGGACATGTGAACTTATATATTT 428 HB ITGGALPAGALTITIALIAGGTAAAGGGGAAGTATTACAAATGGAAGATGATCTGGTGAT 647 549 TICATIFCAGITAATGCTATGTGTCCTTGACTATTTATATAAACTGTCACCTCCCATGTT 608 Caps tetracycline responsive expression vector (IREV), which contains a sequence encoding a lusion protein comprising a transcriptional transactivation domain (TTD) operatively attached to a tetracycline repressor protein (TTB), the first sequence operatively positioned downstream of a promoter. The vector also contains a cloning site downstream of a promoter. The respectively positioned downstream of a basal promoter comprising a letracycline operator. The TREVs can be used to produce stable cell lines in which gene expression is tightly regulated by tetracycline. 5.28 GACACAGCAGCAGTTCGATATCTACTGAAATAAATTCTGCATTGGTAAAAACTTTC 228 TIGGITAAÇTIGGAAAAATTICATÇIGTGGATGGAGTATTGGGAGGTTATATTCAAAA 448 GITCACITTIACTGACCTACAGAAAAACATAGAAATGAGTGCCATAAATTCTTTAACTT 4...8 ACTAAAAGAAATTGATACCAGTACCAAAGTTGATAAFGCTATGTCAAGACTGTTGAAGAA 18 LICALLICACTIANICCIALGICITGACIALITITATTAAACTCTCCCCATGTT TERT GOGGOOD PROAPPROAPPROGRANG CAALAGCAAAGETAGAAAT GATAGAAGAATTAT ** B. intration of a foldoworase artivity and inhibition of one or both of go net incoming account of the problem of the problem of the problem of the division cycle. Binding of INK4 family members, e.g. the tumour suppressor pickness, cold and olds, releases the reliation of Rb division cycle. Binding of INK4 family members, e.g. the tumour suppressor pickness in division excless pickness in a cold library respectively and reversibly inactivate an Rb TW4 fathway respectively and reversibly inactivate and Rb TW4 fathway respectively and reversibly inactivate and Rb TW4 fathway respectively and reversibly inactivate and Rb TW4 fathway respectively and reversibly inactivate and Rb TW4 fathway respectively and reversibly inactivate and Rb TW4 fathway respectively and reversibly inactivate and Rb TW4 fathway respectively of Rb/TV2 fathway the energy respectively of the fathway inactivate and for reliation of the methods are used in the method and for other which bypasses Rb and/or p53. Antisense constructs of the Kb and pickness may also be used. The methods are useful for increasing the proliferative capacity of cells. The cells are stablemently of use in pharmaceutical and cosmetic preparations used to replace tumour cell three in vitro and for studies on blockemical and physiological aspects of new in the production of normal or genetically engineered.
